CmpE493 - Assignment 3 Report
A Book Recommendation System

Model For Genres

For genres, TF-IDF weighting based cosine similarity scoring is used.

Model Parameters

No threshold is used for terms since tf-idf weighting already gives more weights to raw words and gives low weight to common words. Tf-idf weighting provides this functionality by using document frequency informations in addition to term frequencies.

For α(alpha), I've chosen the value 0.5 since it provides better results than other candidate values.
